Problem Definition

The rapidly evolving space industry, especially in the domain of cooperative missions and satellite constellations, faces significant challenges in **mission planning and execution**. These include the integration of complex spacecraft models, thrusters, sensorics, and inter-satellite communication.

The high costs and technical barriers of current simulation tools hinder efficient mission testing and development, leading to **increased risks and impediments in collaborative space endeavors**.

* GNC - guidance, navigation, control

Problem Definition

Space scAvengers's idea of usage of autonomous multi-agent systems **recognized by European Space Agency** for Space Transportation System and In-orbit servicing solutions

• **in-space transportation**, in-orbit servicing, manufacturing, assembly

Orbital Servicing missions require new approach of
 preparation and validation in era of new space
 market opportunities

... but **dedicated automated autonomous software solutions** for **simulations**, GNC and space services are **missing**

* GNC - guidance, navigation, control

Our Solution

Development of software solutions for servicing missions in Space

Enables validation of automated orbital servicing missions (based on cooperative approach)

Our Solution

Development of software solutions for servicing missions in Space

Enables validation of automated orbital servicing missions (based on cooperative approach)

* GNC - guidance, navigation, control

Our Solution

Ongoing development of simulator tool

Market

Space scAvengers's innovative simulator, designed for the rapidly expanding **small satellite sector**, offers a **unique solution to the high costs and risks associated with space missions**. Tailored for **emerging space startups and smaller agencies**, our simulator is a strategic asset, crucial for mission planning and reducing potential failures. With capabilities like AI-driven models, GNC systems, and inter-satellite communication, it's poised to revolutionize mission planning and execution. This aligns perfectly with the **needs of constellation producers**, who could **save millions** in development and testing, as well as Earth observation pioneers like Planet Labs, potentially saving them up to \$2 million in operational efficiency.
